# Radiotherapy in Non Hodgkin Lymphoma: dose

Michela Buglione di Monale  
Cattedra di Radioterapia

Brescia -14 Maggio 2010

## Radiotherapy in NHL's

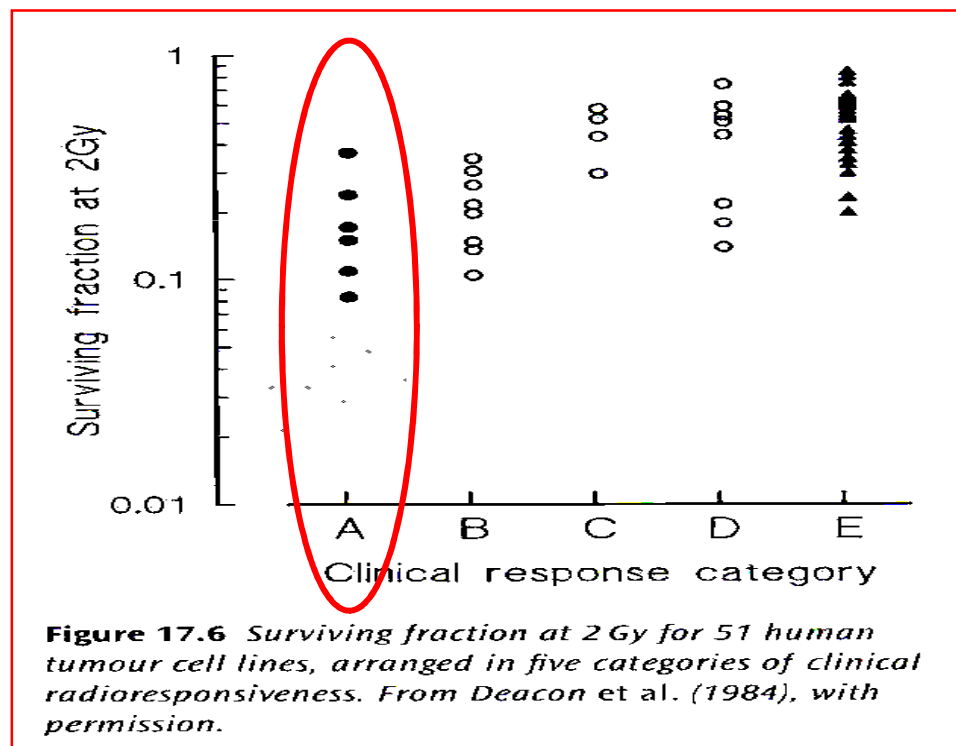

- dose needed to control disease?

nodal DLCL stage I-II vs III-IV  
extranodal DLCL

- dose-related toxicity?

Radiosensibility: where do we stand with lymphomas?  
We all know since many years that...

**A: LINFOMA, MIELOMA, NEUROBLASTOMA**

**B: MEDULLOBLASTOMA, SCLC**

**C: CA MAMMARIO, VESCICALE, CERVICE UTERINA**

**D: CA PANCREAS, COLORETTALE, NSCLC**

**E: MELANOMA, OSTEOSARCOMA, GLIOBLASTOMA**

## Stage I-II DLBC lymphoma in the clinic

### First question

Is the radiotherapy dose needed to control disease equal to zero? (null hypothesis)

### Second question

If not, what dose is needed to control disease?

## I-II DLBC NHL

Radiotherapy is useful .... But not alone..

R.W. Tsang · M.K. Gospodarowicz

**Management of localized (stage I and II) clinically aggressive lymphomas**

1967-1998

## Radiotherapy in I-II DLBC NHL

combined modality treatment – randomized trials					
	n° PTS	Stage	treat	FFP/RFS	OS
<b>SWOG 8736</b> Miller (NEJM 1998)	401	I or IEA (b/non b) II or IIEA (non b)	Cx3 → IFRT vs CHOP x8	77% vs 68%	92% vs 72%
<b>ECOG 1484</b> Horning (JCO 2004)	215	I (b or EN only) II (b/non b)	Cx8 if CR → RT vs no RT if PR → RT	70% 53% 63%	79% 67% 69%
<b>GELA LNH 93-1</b> Reyes (NEJM 2005)	647	Age <60 (10%b; 50%EN; no AA IPI factors)	Intensive CHT alone vs Cx3 → RT	82% 74%	90% 81%
<b>GELA LNH 93-4</b> Bonnet (JCO 2007)	576	Age >60 (8%b; 56% EN; no AA IPI factors)	Cx4 → RT vs Cx4	66% vs 68%	72% vs 68%

## Radiotherapy in I-II DLBC NHL

combined modality treatment – randomized trials		
	treat	dose
<b>SWOG 8736</b> Miller (NEJM 1998)	Cx3 → IFRT vs CHOP x8	<b>40-55 Gy</b> (no stated criteria ; probably PR pts had >40Gy; the n° of pts with PR is unknown)
<b>ECOG 1484</b> Horning (JCO 2004)	Cx8 if CR → RT vs no RT if PR → RT	<b>CR → 30 Gy</b>  <b>PR → 40 Gy</b> (outcome similar for CR pts after CHT alone)
<b>GELA LNH 93-1</b> Reyes (NEJM 2005)	Intensive CHT alone vs Cx3 → RT	Planned dose <b>40 Gy</b>  Given dose <b>36-40 Gy</b> (lower; <u>no decision</u> criteria; 26 pts were not given RT)
<b>GELA LNH 93-4</b> Bonnet (JCO 2007)	Cx4 → RT vs Cx4	Planned <b>40 Gy</b> Given dose <b>36-44 Gy</b> (39 pts were not given RT)

***Radiotherapy is therefore an essential part of integrated treatment, but data reported on RT doses are often poor quality data.... Especially when the reporting author is not a radiation oncologist***

**QUALITY OF RADIOTHERAPY REPORTING IN RANDOMIZED CONTROLLED TRIALS OF HODGKIN'S LYMPHOMA AND NON-HODGKIN'S LYMPHOMA: A SYSTEMATIC REVIEW**

BCCA (JCO '00)	308	I-IIA; EN	10x3Gy; 20x1.75Gy	97%	87%	81%	Survival is IPI strongly related
Holland (rad oncol '01)	128	I; EN	CR 26 Gy PR 40 Gy	91%	nn	74%	no better outcome in CR pts with 40 Gy;
MDACC (IJROBP '95)	190	I-II-III ; EN	30-40 Gy + 10-15 Gy	nn	62%	58%	Local control 97% ≥40 and 83% 30-40 Gy; 88% and 71% when bulky
Holland (rad oncol '98)	94	I A e B; EN	36 Gy (6-8) 40 Gy (3-4)	nn	89%	83%	RT dose varying with CHT cycles N°
INT (JCO '93)	183	I-II (no > 3)	40-44 Gy	98%	nn	83%	36 Gy on uninvolved regions
Univ of Florida (IJROBP '99)	213	I-II	30-50 Gy	nn	nn	66%	>40Gy → Better outcome in pts with bulky disease and PR
MDACC (IJROBP '01)	172	I-II; EN	30-50.4Gy (BED 29-51 Gy)	Nn	nn	nn	BED 29-39 Gy → poorer local control in bulky;

# Radiotherapy in I-II DLBC NHL

combined modality treatment – randomized trials					Dose in different trials						
	n° PTS	Stage	treat	FFP /RF	n° pts	stage	dose	CR	5yDS S	5y PFS	note
SWOG 8736 Miller (NEJM 1998)	401	I or IEA (b/p)							nn	69%	>=40 Gy no better EFS; no in b
ECOG 1484 Horning (JCO 2004)										81%	Survival IPI strongly related
GELA LNH 93-1 R (NEJM 2005)											on sig trend better outcome in 40 Gy CR;
GELA LNH 93-4 Bonnet (JCO 2007)		no A factors)									control 97% and 83% 30-40 % and 71% in b
											Gy on uninvolv regions
											>40Gy → Better outcome in pts with b disease and PR
									nn	nn	BED 29-39 Gy → poorer local control in b;

**NO RANDOMIZED TRIALS TO EVALUATE THE DOSE AVAILABLE.**

- => 40 Gy is probably better;
- some authors suggest 30-36 Gy after 6-8 CHOP is enough..but: do we need > 6 CHOP? Patient selection?
- in patients in RP or with CR but bulky disease a 40-46 Gy dose is warranted

## Stage III-IV DLBC lymphoma in the clinic

### First question

Is the radiotherapy dose needed to control disease equal to zero? (null hypothesis)

### Second question

If not, what dose is needed to control disease?

**Probably YES!**

# Radiotherapy dose should be > 0 ?

Dose in different trials							
Centre	n° pts	stage	dose	CR	5yDSS	5y PFS	note
<b>Aviles IJROBP 1994</b>	341 in CR after CHT	IV b	<b>In CR pts 40 Gy vs no RT</b>			82% vs 55%	<b>5 y OS</b> 87% vs 66%
<b>Schlernbach (MDACC) IJROBP 2000</b>	59	III-IV	<b>CHOP → 30-50 Gy vs no RT</b>	89% vs 52%		85% vs 51% *	<ul style="list-style-type: none"> <li>• LC 89% vs 33% in <b>&gt;4cm*</b></li> <li>• Small and bulky lesion</li> <li>• no diff in OS</li> </ul>
<b>Aviles MEDICAL ONCOL 2005</b>	106	III-IV	<b>In PR after CHT 30 Gy Vs no RT</b>			86% vs 32%	<b>10 y OS</b> 89% vs 68%
<b>Moser IJROBP 2006</b>	238 (114 in PR)	III-IV	<b>In PR after CHT 40 Gy vs 2° line CHT (or ASCT)</b>	61% Vs 21% (75%)		Better with RT	<b>5 y OS after CR</b> 61% vs 32% (68%)

Are there subgroups getting a larger benefit from RT.....?

**May be the bulky cases ?!**

Dose in different trials

**NO definitive RANDOMIZED TRIALS TO EVALUATE - DOSE - INDICATIONS**

- RT could have a role in stage III-IV bulky disease pts and in those with residual mass after chemotherapy
- 40 Gy RT represent the standard

## Radiotherapy in DLBC NHL

**NO definitive RANDOMIZED TRIALS TO EVALUATE THE DOSE**

### **STAGE I-II**

- 40 Gy after 3-4 CHOP
- (30-36 Gy for CR pts after 6-8 CHOP?)
- in patients in RP or CR but bulky disease a 40-46 Gy dose is warranted

**NO definitive RANDOMIZED TRIALS TO EVALUATE**  
**-DOSE**  
**- INDICATIONS**

### **STAGE III-IV**

- RT could have a role in stage III-IV bulky disease and in pts with residual mass after chemotherapy
- 40 Gy RT represent the standard

The current guidelines however refer to patients treated with the addition of Rituximab and after PET staging

**NCCN<sup>®</sup> Practice Guidelines in Oncology – v.1.2010 Diffuse L**

**STAGE**

**Stage I-II**

**Stage III-IV**

**Nonbulky (< 10 cm)**

**Bulky (≥ 10 cm)**

**Adverse risk factors present:**

- Elevated LDH
- Stage II
- Age > 60 y
- Performance status ≥ 2

**Adverse risk factors not present**

**RCHOP x 3 cycles + locoregional RT (30-36 Gy)**  
or  
**RCHOP 6 or 8 cycles<sup>m</sup> ± locoregional RT (30-36 Gy to involved region)**

**RCHOP x 3 cycles + locoregional RT (30-36 Gy)**  
or  
**RCHOP 6 or 8 cycles<sup>m</sup> ± RT (category 2B for RT)**

**RCHOP 6 or 8 cycles<sup>m</sup> ± locoregional RT (30-40 Gy to involved region) (category 1)**

**bulky**

**residual**

<sup>1</sup>In testicular lymphoma, after completion of chemotherapy, RT should be given to contralateral testis (30-36 Gy).  
<sup>2</sup>In patients who are not candidates for chemotherapy involved field radiation therapy (IFRT) is recommended.  
<sup>3</sup>In selective settings (paranasal sinus, testicular, epidural, bone marrow with large cell lymphoma, HIV lymphoma, or ≥ 2 extranodal sites), CNS prophylaxis should be given (4-8 doses of intrathecal methotrexate and/or cytarabine during the course of treatment). Recent data regarding Stage IIE DLBCL of breast has been suggested as a potential risk for CNS disease.  
<sup>4</sup>Recommendations are for HIV-negative lymphoma only.  
<sup>5</sup>May include high-dose therapy.  
<sup>6</sup>Based on current clinical trials, CHOP-like regimens are comparable to anthracycline-based regimens in terms of efficacy and reduced toxicities, but other comparable anthracycline-based regimens are also used.  
<sup>7</sup>For other regimens, see BCEL-3.  
<sup>8</sup>In selected cases, RT to involved sites of disease may be beneficial (category 2B).

Note: All recommendations are category 2A unless otherwise indicated.  
Clinical Trials: NCCN believes that the best management of any cancer patient is in a clinical trial. Participation in clinical trials is especially encouraged.

It is not intended to be used as a substitute for the judgment of a clinician. Any form without the express written permission of NCCN. BCEL-3

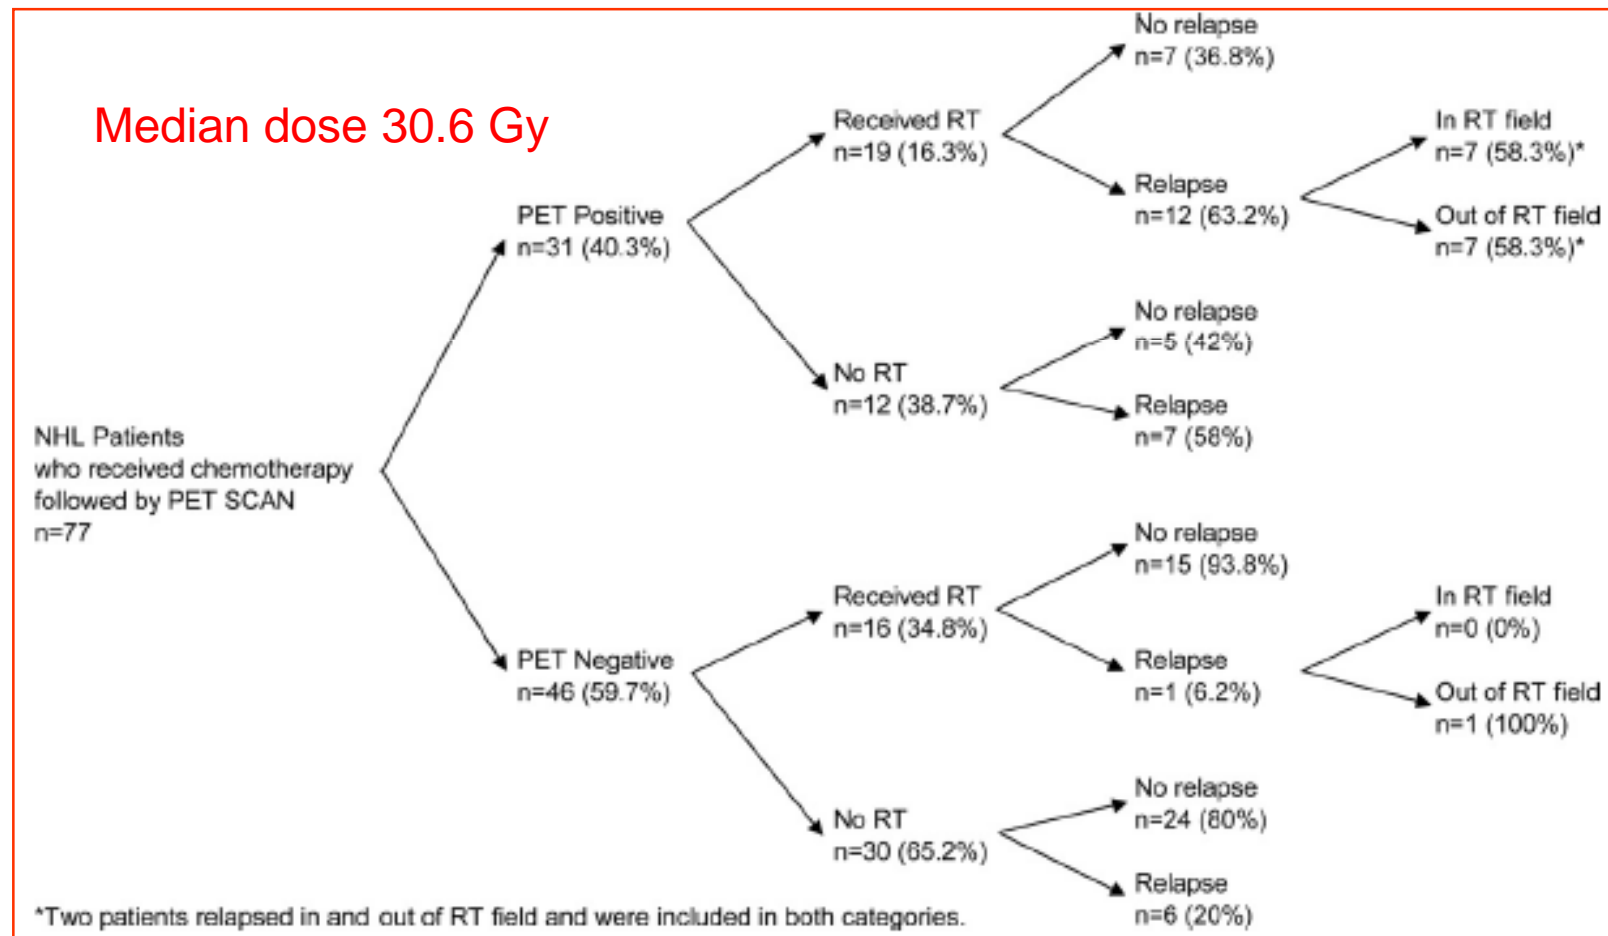

## Radiotherapy dose in DLBC :

- role of PET:
  - predict the outcome;
  - **decision on RT dose?**
- role of association with Rituximab
  - **need for change of RT dose?**

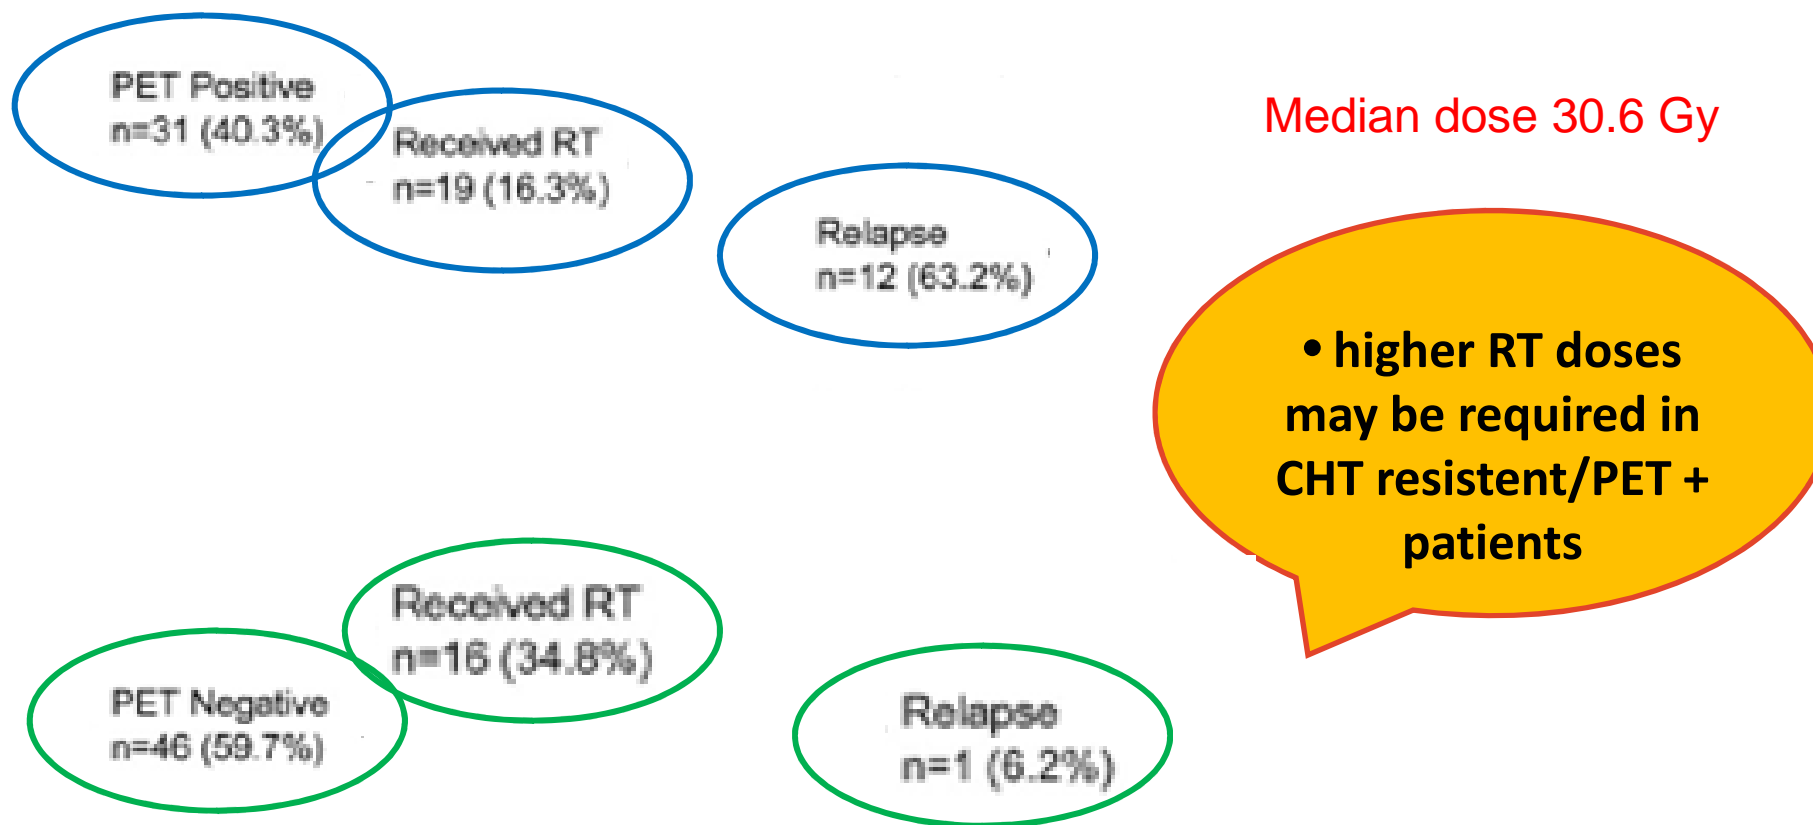

# PET to predict the outcome and to help to define RT dose

# PET to predict the outcome and to help to define RT dose

# Is this the reason why....?

**NCCN<sup>®</sup> Practice Guidelines in Oncology – v.1.2010 Diffuse Large B-Cell Lymphoma**

[Guidelines Index](#)  
[NHL Table of Contents](#)  
[Staging, Discussion, References](#)

**PRE RT EVALUATION**

Stage I, II: Pre RT evaluation, repeat all positive studies. If PET-CT scan positive, rebiopsy before changing course of treatment.

- Complete response<sup>r</sup> (PET negative)
- Partial response<sup>r,s</sup> (PET positive)
- No response or progressive disease<sup>r</sup>

**FOLLOW UP THERAPY**

**END OF TREATMENT INITIAL RESPONSE**

**Partial response<sup>r,s</sup> (PET positive)**

**Complete course of therapy with higher RT dose (40-45 Gy)<sup>t</sup> or High dose therapy with autologous stem cell rescue or Clinical trial (may include high dose therapy with allogeneic stem cell rescue)**

<sup>r</sup>See Response Criteria for Lymphoma (NHODG-C).  
<sup>s</sup>Documented PR includes a biological measure of disease: positive PET-CT scan, or ideally positive biopsy.  
<sup>t</sup>Wait a minimum of 8 weeks after RT to repeat PET-CT scan. The optimum timing of repeat PET-CT is unknown. False positives may occur due to posttreatment changes.  
<sup>u</sup>There is evidence that addition of maintenance rituximab does not improve survival.  
<sup>y</sup>Patients in first remission may be candidates for consolidation trials including high dose therapy with autologous stem cell rescue.

**Note:** All recommendations are category 2A unless otherwise indicated.  
**Clinical Trials:** NCCN believes that the best management of any cancer patient is in a clinical trial. Participation in clinical trials is especially encouraged.

# Role of association with Rituximab

- Comparison with previous trial

## SWOG 0014

- ph 2
- CHOP+ Rituximab +RT
- low risk

## Role of association with Rituximab

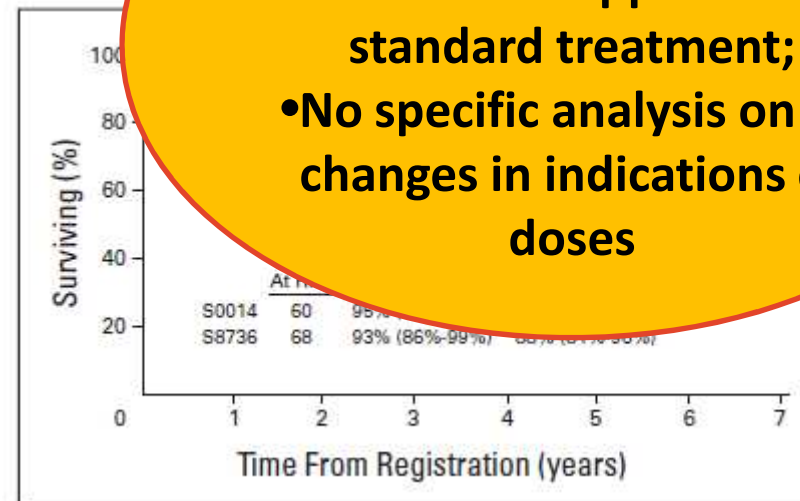

JCO 2008 26 (14): 2258  
 NEJM 2002 346: 235  
 JCO 2005 23: 4117

### SWOG 0014

- ph 2
- CHOP
- low

• In trial comparing CHOP vs R-CHOP RT is not studied but applied as a standard treatment;  
 • No specific analysis on RT changes in indications or doses

- Comparison with previous trial

## Radiotherapy for **extranodal (DLBC)** lymphoma

- Substantially the same questions could be posed
- Substantially similar answers are obtained

We will only give a few examples

# Cutaneous lymphoma

**low grade**

**high grade**

HISTOLOGY / DOSE of RT / OUTCOME				
HISTOLOGY	Dose Gy	N°PTS	CR %	Relapse %
PCMZL	30-45	132	99	46
PCFCL	20-54	460	99	47
PCLBCL	>= 40	101	88	58

**RT alone:  
30-36 Gy**

**RT alone:  
40-46 Gy**

## Head and neck DLBC

- RT obtain a **good local control**, however **almost 50%** of patients (even in early stage) relapse 22-42% in extranodal sites, **out of RT portals; high percentage of local relapse without RT**

**RT alone:  
40-50 Gy**

**Combined modality  
treat:  
CHOP + RT  
CR: 30-36 Gy  
PR or bulky: 40-46 Gy**

## DLBC NHL: breast

Ann Oncol 2008 19: 233

### Primary diffuse large B-cell lymphoma of the breast: prognostic factors and outcomes of a study by the International Extranodal Lymphoma Study Group

RT dose (ipsilateral breast, n = 110)	Median	40 Gy	
	Range	4-60 Gy	
	Distribution		
	<30 Gy	4	4
	30-39.9 Gy	34	31
	40-49.9 Gy	61	55
	≥50 Gy	11	10

- good IPI,
- anthracycline-containing cht
- radiotherapy (RT)

- CMT
- RT 36-46 Gy

## Orbital NHL

- the median dose for low-grade tumors was 30 -36 Gy

- the median dose for intermediate and high-grade tumors was 40 – 46 Gy

3D dose distribution

Discard spatial, anatomic, biologic

Extract unambiguous data

- Single Point: e.g. V20
- Global: e.g. mean dose

Compute model-based NTCP estimates

## Late toxicity Quantec or not to Quantec?

POINT of discussion

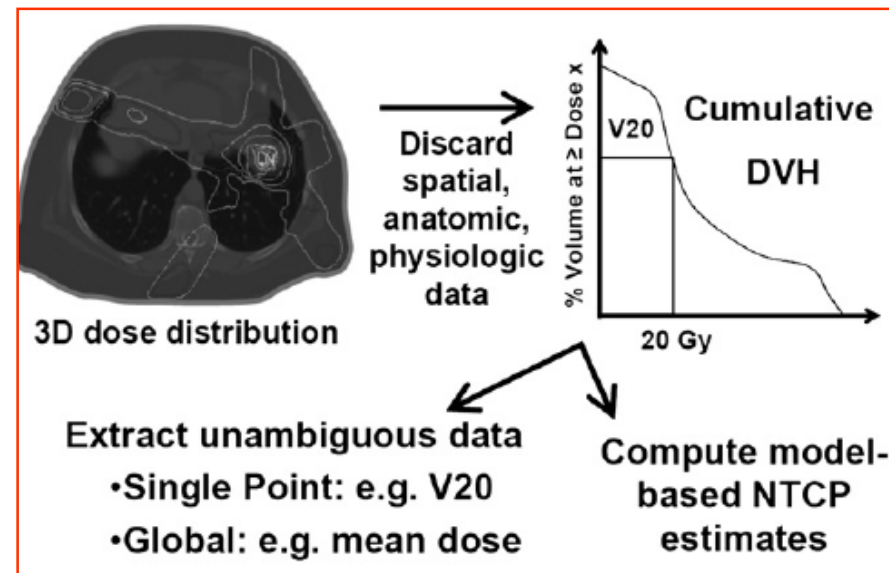

dream of a NTCP-based planning will probably remain a (dangerous?) dream for a very long time and the variety of treated volumes involved in DLCL lymphomas precludes a meaningful summary of the reported toxicities.

However, an accurate reporting of toxicity data is the pre-requisite to answer the question of organ-specific toxicity for low dose treatments such as those needed for the treatment of DLCL.

Lung, salivary glands and heart are often considered major dose limiting organs in the treatment of lymphomas.

While good quality long term data are missing for the dose levels actually used, the additional toxicity from CHT should be considered.
